All, the USAG Humphreys Fire Department will begin fire hydrant flow testing on Friday, 13 April 2012. The Garrison can expect the tests to go on until the end of the month. Regular fire hydrant flow testing is a significant component of the Garrison's water supply program. Water systems are constantly being impacted by new construction, improvements, deterioration, changes in usage, and even water maintenance activities which may affect zone valve settings. It is very important to test all fire hydrants and make sure they are functioning correctly to determine their capabilities in case of an emergency. In addition to determining flow pressure and rates, it also helps to identify if there are any other problems with the fire hydrant. Fire fighters, fire vehicles, standing water and wet roads will be encountered in areas of fire hydrants so please take caution when approaching. If you have any questions, please contact the Fire Prevention Office at 753-6175
